MITSUBISHI MICROCOMPUTERS 3850 Group

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

DESCRIPTION

The 3850 group is the 8-bit microcomputer based on the 740 family core technology.

The 3850 group is designed for the household products and office automation equipment and includes serial I/O functions, 8-bit timer, and A-D converter.

FEATURES

Basic machine-language instructions
 Minimum instruction execution time0.5 μs
(at 8 MHz oscillation frequency)
Memory size
ROM 8K to 24K bytes
RAM 512 to 640 byte
Programmable input/output ports
Interrupts 14 sources, 14 vectors
• Timers
• Serial I/O 8-bit X 1(UART or Clock-synchronized)
• PWM
•A-D converter 10-bit X 5 channels
•Watchdog timer 16-bit X 1
Clock generating circuit Built-in 2 circuits
(connect to external ceramic resonator or quartz-crystal oscillator)

Power source voltage
In high-speed mode 4.0 to 5.5 V
(at 8 MHz oscillation frequency)
In high-speed mode 2.7 to 5.5 V
(at 4 MHz oscillation frequency)
In middle-speed mode 2.7 to 5.5 V
(at 8 MHz oscillation frequency)
In low-speed mode 2.7 to 5.5 V
(at 32 kHz oscillation frequency)
Power dissipation
In high-speed mode
(at 8 MHz oscillation frequency, at 5 V power source voltage)
In low-speed mode 60 μW
(at 32 kHz oscillation frequency, at 3 V power source voltage)
•Operating temperature range20 to 85°C

APPLICATION

Office automation equipment, FA equipment, Household products, Consumer electronics, etc.

Fig. 1 M38503M4-XXXFP/SP pin configuration

GROUP EXPANSION

Mitsubishi plans to expand the 3850 group as follows:

Memory Type

Support for mask ROM, One Time PROM, and EPROM versions.

Memory Size

ROM/PROM size	8K to 24K bytes
RAM size	512 to 640 bytes

Packages

Fig. 4 Memory expansion plan

Currently planning products are listed below.

Table 2 Support products

As of August 1998

Product name	(P) ROM size (bytes) ROM size for User in ()	RAM size (bytes)	Package	Remarks

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

FUNCTIONAL DESCRIPTION CENTRAL PROCESSING UNIT (CPU)

The 3850 group uses the standard 740 Family instruction set. Refer to the table of 740 Family addressing modes and machine instructions or the 740 Family Software Manual for details on the instruction set.

Machine-resident 740 Family instructions are as follows:

The FST and SLW instructions cannot be used.

The STP, WIT, MUL, and DIV instructions can be used.

[CPU Mode Register (CPUM)] 003B16

The CPU mode register contains the stack page selection bit, etc. The CPU mode register is allocated at address 003B16.

Fig. 5 Structure of CPU mode register

MEMORY Special Function Register (SFR) Area

The Special Function Register area in the zero page contains control registers such as I/O ports and timers.

RAM

RAM is used for data storage and for stack area of subroutine calls and interrupts.

ROM

The first 128 bytes and the last 2 bytes of ROM are reserved for device testing and the rest is user area for storing programs.

Interrupt Vector Area

The interrupt vector area contains reset and interrupt vectors.

Zero Page

Access to this area with only 2 bytes is possible in the zero page addressing mode.

Special Page

Access to this area with only 2 bytes is possible in the special page addressing mode.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

I/O PORTS

The I/O ports have direction registers which determine the input/ output direction of each individual pin. Each bit in a direction register corresponds to one pin, and each pin can be set to be input port or output port.

When "0" is written to the bit corresponding to a pin, that pin becomes an input pin. When "1" is written to that bit, that pin becomes an output pin.

If data is read from a pin which is set to output, the value of the port output latch is read, not the value of the pin itself. Pins set to input are floating. If a pin set to input is written to, only the port output latch is written to and the pin remains floating.

Table 3 I/O port function

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Fig. 9 Port block diagram (2)

INTERRUPTS

Interrupts occur by 14 sources among 14 sources: six external, seven internal, and one software.

Interrupt Control

Each interrupt is controlled by an interrupt request bit, an interrupt enable bit, and the interrupt disable flag except for the software interrupt set by the BRK instruction. An interrupt occurs if the corresponding interrupt request and enable bits are "1" and the interrupt disable flag is "0".

Interrupt enable bits can be set or cleared by software.

Interrupt request bits can be cleared by software, but cannot be set by software.

The BRK instruction cannot be disabled with any flag or bit. The I (interrupt disable) flag disables all interrupts except the BRK instruction interrupt.

When several interrupts occur at the same time, the interrupts are received according to priority.

Interrupt Operation

By acceptance of an interrupt, the following operations are automatically performed:

- 1. The contents of the program counter and the processor status register are automatically pushed onto the stack.
- 2. The interrupt disable flag is set and the corresponding interrupt request bit is cleared.
- 3. The interrupt jump destination address is read from the vector table into the program counter.

■Notes

When the active edge of an external interrupt (INT0–INT3, CNTR0, CNTR1) is set, the corresponding interrupt request bit may also be set. Therefore, take the following sequence:

- 1. Disable the interrupt
- 2. Change the interrupt edge selection register
- (the timer XY mode register for CNTR0 and CNTR1) 3. Clear the interrupt request bit to "0"
- 4. Accept the interrupt.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Fig. 10 Interrupt control

TIMERS

The 3850 group has four timers: timer X, timer Y, timer 1, and timer 2.

The division ratio of each timer or prescaler is given by 1/(n + 1), where n is the value in the corresponding timer or prescaler latch. All timers are count down. When the timer reaches "0016", an underflow occurs at the next count pulse and the corresponding timer latch is reloaded into the timer and the count is continued. When a timer underflows, the interrupt request bit corresponding to that timer is set to "1".

Fig. 12 Structure of timer XY mode register

Fig. 13 Structure of timer count source selection register

Timer 1 and Timer 2

The count source of prescaler 12 is the oscillation frequency which is selected by timer 12 count source selection bit. The output of prescaler 12 is counted by timer 1 and timer 2, and a timer underflow sets the interrupt request bit.

Timer X and Timer Y

Timer X and Timer Y can each select in one of four operating modes by setting the timer XY mode register.

(1) Timer Mode

The timer counts the count source selected by Timer count source selection bit.

(2) Pulse Output Mode

The timer counts the count source selected by Timer count source selection bit. Whenever the contents of the timer reach "0016", the signal output from the CNTR0 (or CNTR1) pin is inverted. If the CNTR0 (or CNTR1) active edge selection bit is "0", output begins at " H".

If it is "1", output starts at "L". When using a timer in this mode, set the corresponding port P27 (or port P40) direction register to output mode.

(3) Event Counter Mode

Operation in event counter mode is the same as in timer mode, except that the timer counts signals input through the CNTR0 or CNTR1 pin.

When the CNTR₀ (or CNTR₁) active edge selection bit is "0", the rising edge of the CNTR₀ (or CNTR₁) pin is counted.

When the CNTR₀ (or CNTR₁) active edge selection bit is "1", the falling edge of the CNTR₀ (or CNTR₁) pin is counted.

(4) Pulse Width Measurement Mode

If the CNTR0 (or CNTR1) active edge selection bit is "0", the timer counts the selected signals by the count source selection bit while the CNTR0 (or CNTR1) pin is at "H". If the CNTR0 (or CNTR1) active edge selection bit is "1", the timer counts it while the CNTR0 (or CNTR1) pin is at "L".

The count can be stopped by setting "1" to the timer X (or timer Y) count stop bit in any mode. The corresponding interrupt request bit is set each time a timer underflows.

Note

When switching the count source by the timer 12, X and Y count source bit, the value of timer count is altered in unconsiderable amount owing to generating of a thin pulses in the count input signals.

Therefore, select the timer count source before set the value to the prescaler and the timer.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Fig. 14 Block diagram of timer X, timer Y, timer 1, and timer 2

SERIAL I/O

Serial I/O can be used as either clock synchronous or asynchronous (UART) serial I/O. A dedicated timer is also provided for baud rate generation.

(1) Clock Synchronous Serial I/O Mode

Clock synchronous serial I/O mode can be selected by setting the serial I/O mode selection bit of the serial I/O control register (bit 6 of address 001A16) to "1".

For clock synchronous serial I/O, the transmitter and the receiver must use the same clock. If an internal clock is used, transfer is started by a write signal to the TB/RB.

Fig. 15 Block diagram of clock synchronous serial I/O

(2) Asynchronous Serial I/O (UART) Mode

Clock asynchronous serial I/O mode (UART) can be selected by clearing the serial I/O mode selection bit (b6) of the serial I/O control register to "0".

Eight serial data transfer formats can be selected, and the transfer formats used by a transmitter and receiver must be identical.

The transmit and receive shift registers each have a buffer, but the

two buffers have the same address in memory. Since the shift register cannot be written to or read from directly, transmit data is written to the transmit buffer register, and receive data is read from the receive buffer register.

The transmit buffer register can also hold the next data to be transmitted, and the receive buffer register can hold a character while the next character is being received.

Fig.17 Block diagram of UART serial I/O

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Fig. 18 Operation of UART serial I/O function

[Transmit Buffer Register/Receive Buffer Register (TB/RB)] 001816

The transmit buffer register and the receive buffer register are located at the same address. The transmit buffer is write-only and the receive buffer is read-only. If a character bit length is 7 bits, the MSB of data stored in the receive buffer is "0".

[Serial I/O Status Register (SIOSTS)] 001916

The read-only serial I/O status register consists of seven flags (bits 0 to 6) which indicate the operating status of the serial I/O function and various errors.

Three of the flags (bits 4 to 6) are valid only in UART mode.

The receive buffer full flag (bit 1) is cleared to "0" when the receive buffer register is read.

If there is an error, it is detected at the same time that data is transferred from the receive shift register to the receive buffer register, and the receive buffer full flag is set. A write to the serial I/O status register clears all the error flags OE, PE, FE, and SE (bit 3 to bit 6, respectively). Writing "0" to the serial I/O enable bit SIOE (bit 7 of the serial I/O control register) also clears all the status flags, including the error flags.

Bits 0 to 6 of the serial I/O status register are initialized to "0" at reset, but if the transmit enable bit (bit 4) of the serial I/O control register has been set to "1", the transmit shift completion flag (bit 2) and the transmit buffer empty flag (bit 0) become "1".

Serial I/O Control Register (SIOCON)] 001A16

The serial I/O control register consists of eight control bits for the serial I/O function.

[UART Control Register (UARTCON)] 001B16

The UART control register consists of four control bits (bits 0 to 3) which are valid when asynchronous serial I/O is selected and set the data format of an data transfer and one bit (bit 4) which is always valid and sets the output structure of the P25/TxD pin.

[Baud Rate Generator (BRG)] 001C16

The baud rate generator determines the baud rate for serial transfer.

The baud rate generator divides the frequency of the count source by 1/(n + 1), where n is the value written to the baud rate generator.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

PULSE WIDTH MODULATION (PWM)

The 3850 group has a PWM function with an 8-bit resolution, based on a signal that is the clock input XIN or that clock input divided by 2.

Data Setting

The PWM output pin also functions as port P44. Set the PWM period by the PWM prescaler, and set the "H" term of output pulse by the PWM register.

If the value in the PWM prescaler is n and the value in the PWM register is m (where n = 0 to 255 and m = 0 to 255) :

PWM period = $255 \times (n+1) / f(X_{IN})$

= 31.875 X (n+1) μs (when f(XIN) = 8 MHz)

Output pulse "H" term = PWM period X m / 255

= 0.125 X (n+1) X m μs (when f(XIN) = 8 MHz)

PWM Operation

When bit 0 (PWM enable bit) of the PWM control register is set to "1", operation starts by initializing the PWM output circuit, and pulses are output starting at an "H".

If the PWM register or PWM prescaler is updated during PWM output, the pulses will change in the cycle after the one in which the change was made.

Fig. 20 Timing of PWM period

Fig. 21 Block diagram of PWM function

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Fig. 22 Structure of PWM control register

Fig. 23 PWM output timing when PWM register or PWM prescaler is changed

■Note

The PWM starts after the PWM enable bit is set to enable and "L" level is output from the PWM pin. The length of this "L" level output is as follows:

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

A-D CONVERTER [A-D Conversion Registers (ADL, ADH)] 003516, 003616

The A-D conversion registers are read-only registers that store the result of an A-D conversion. Do not read these registers during an A-D conversion

[AD Control Register (ADCON)] 003416

The AD control register controls the A-D conversion process. Bits 0 to 2 select a specific analog input pin. Bit 4 indicates the completion of an A-D conversion. The value of this bit remains at "0" during an A-D conversion and changes to "1" when an A-D conversion ends. Writing "0" to this bit starts the A-D conversion.

Comparison Voltage Generator

The comparison voltage generator divides the voltage between AVss and VREF into 1024 and outputs the divided voltages.

Channel Selector

The channel selector selects one of ports P30/AN0 to P34/AN4 and inputs the voltage to the comparator.

Comparator and Control Circuit

The comparator and control circuit compare an analog input voltage with the comparison voltage, and the result is stored in the A-D conversion registers. When an A-D conversion is completed, the control circuit sets the A-D conversion completion bit and the A-D interrupt request bit to "1".

Note that because the comparator consists of a capacitor coupling, set $f(X{\sc in})$ to 500 kHz or more during an A-D conversion.

Fig. 24 Structure of AD control register

Fig. 25 Structure of A-D conversion registers

Fig. 26 Block diagram of A-D converter

WATCHDOG TIMER

The watchdog timer gives a mean of returning to the reset status when a program cannot run on a normal loop (for example, because of a software run-away). The watchdog timer consists of an 8-bit watchdog timer L and an 8-bit watchdog timer H.

Standard Operation of Watchdog Timer

When any data is not written into the watchdog timer control register (address 003916) after resetting, the watchdog timer is in the stop state. The watchdog timer starts to count down by writing an optional value into the watchdog timer control register (address 003916) and an internal reset occurs at an underflow of the watchdog timer H.

Accordingly, programming is usually performed so that writing to the watchdog timer control register (address 003916) may be started before an underflow. When the watchdog timer control register (address 003916) is read, the values of the high-order 6 bits of the watchdog timer H, STP instruction disable bit, and watchdog timer H count source selection bit are read.

Initial value of watchdog timer

At reset or writing to the watchdog timer control register (address 003916), each watchdog timer H and L is set to "FF16."

•Watchdog timer H count source selection bit operation

Bit 7 of the watchdog timer control register (address 003916) permits selecting a watchdog timer H count source. When this bit is set to "0", the count source becomes the underflow signal of watchdog timer L. The detection time is set to 131.072 ms at f(XIN)= 8 MHz frequency and 32.768 s at f(XCIN) = 32 kHz frequency. When this bit is set to "1", the count source becomes the signal divided by 16 for f(XIN) (or f(XCIN)). The detection time in this case is set to 512 µs at f(XIN) = 8 MHz frequency and 128 ms at f(XCIN)= 32 kHz frequency. This bit is cleared to "0" after resetting.

Operation of STP instruction disable bit

Bit 6 of the watchdog timer control register (address 003916) permits disabling the STP instruction when the watchdog timer is in operation.

When this bit is "0", the STP instruction is enabled.

When this bit is "1", the STP instruction is disabled, once the STP instruction is executed, an internal reset occurs. When this bit is set to "1", it cannot be rewritten to "0" by program. This bit is cleared to "0" after resetting.

Fig. 27 Block diagram of Watchdog timer

Fig. 28 Structure of Watchdog timer control register

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

RESET CIRCUIT

To reset the microcomputer, $\overline{\text{RESET}}$ pin must be held at an "L" level for 2 μs or more. Then the $\overline{\text{RESET}}$ pin is returned to an "H" level (the power source voltage must be between 2.7 V and 5.5 V, and the oscillation must be stable), reset is released. After the reset is completed, the program starts from the address contained in address FFFD16 (high-order byte) and address FFFC16 (low-order byte). Make sure that the reset input voltage is less than 0.54 V for Vcc of 2.7 V.

Fig. 29 Reset circuit example

Fig. 30 Reset sequence

Fig. 31 Internal status at reset

CLOCK GENERATING CIRCUIT

The 3850 group has two built-in oscillation circuits. An oscillation circuit can be formed by connecting a resonator between XIN and XOUT (XCIN and XCOUT). Use the circuit constants in accordance with the resonator manufacturer's recommended values. No external resistor is needed between XIN and XOUT since a feed-back resistor exists on-chip. However, an external feed-back resistor is needed between XCIN and XCOUT.

Immediately after power on, only the XIN oscillation circuit starts oscillating, and XCIN and XCOUT pins function as I/O ports.

Frequency Control (1) Middle-speed mode

The internal clock ϕ is the frequency of XIN divided by 8. After reset, this mode is selected.

(2) High-speed mode

The internal clock $\boldsymbol{\varphi}$ is half the frequency of XIN.

(3) Low-speed mode

The internal clock $\boldsymbol{\phi}$ is half the frequency of XCIN.

■Note

If you switch the mode between middle/high-speed and lowspeed, stabilize both XIN and XCIN oscillations. The sufficient time is required for the sub-clock to stabilize, especially immediately after power on and at returning from the stop mode. When switching the mode between middle/high-speed and low-speed, set the frequency on condition that f(XIN) > 3•f(XCIN).

(4) Low power dissipation mode

The low power consumption operation can be realized by stopping the main clock XIN in low-speed mode. To stop the main clock, set bit 5 of the CPU mode register to "1." When the main clock XIN is restarted (by setting the main clock stop bit to "0"), set sufficient time for oscillation to stabilize.

The sub-clock XCIN-XCOUT oscillating circuit can not directly input clocks that are generated externally. Accordingly, make sure to cause an external resonator to oscillate.

Oscillation Control (1) Stop mode

If the STP instruction is executed, the internal clock ϕ stops at an "H" level, and XIN and XCIN oscillation stops. When the oscillation stabilizing time set after STP instruction released bit is "0," the prescaler 12 is set to "FF16" and timer 1 is set to "0116." When the oscillation stabilizing time set after STP instruction released bit is "1," set the sufficient time for oscillation of used oscillator to stabilize since nothing is set to the prescaler 12 and timer 1.

Either XIN or XCIN divided by 16 is input to the prescaler 12 as count source. Oscillator restarts when an external interrupt is received, but the internal clock ϕ is not supplied to the CPU (remains at "H") until timer 1 underflows. The internal clock ϕ is supplied for the first time, when timer 1 underflows. This ensures time for the clock oscillation using the ceramic resonators to be stabilized. When the oscillator is restarted by reset, apply "L" level to the RESET pin until the oscillation is stable since a wait time will not

be generated.

(2) Wait mode

If the WIT instruction is executed, the internal clock ϕ stops at an "H" level, but the oscillator does not stop. The internal clock ϕ restarts at reset or when an interrupt is received. Since the oscillator does not stop, normal operation can be started immediately after the clock is restarted.

To ensure that the interrupts will be received to release the STP or WIT state, their interrupt enable bits must be set to "1" before executing of the STP or WIT instruction.

When releasing the STP state, the prescaler 12 and timer 1 will start counting the clock XIN divided by 16. Accordingly, set the timer 1 interrupt enable bit to "0" before executing the STP instruction.

Note

When using the oscillation stabilizing time set after STP instruction released bit set to "1", evaluate time to stabilize oscillation of the used oscillator and set the value to the timer 1 and prescaler 12.

Fig. 32 Ceramic resonator circuit

Fig. 33 External clock input circuit

Fig. 34 Structure of MISRG

Middle-speed mode automatic switch set bit

By setting the middle-speed mode automatic switch set bit to "1" while operating in the low-speed mode, XIN oscillation automatically starts and the mode is automatically switched to the middle-speed mode when defecting a rising/falling edge of the SCL or SDA pin. The middle-speed automatic switch wait time set bit can select the switch timing from the low-speed to the middle-speed mode; either 4.5 to 5.5 machine cycles or 6.5 to 7.5 machine cycles in the low-speed mode. Select it according to oscillation start characteristics of used XIN oscillator.

The middle-speed mode automatic switch start bit is used to automatically make to XIN oscillation start and switch to the middle-speed mode by setting this bit to "1" while operating in the low-speed mode.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

NOTES ON PROGRAMMING Processor Status Register

The contents of the processor status register (PS) after a reset are undefined, except for the interrupt disable flag (I) which is "1." After a reset, initialize flags which affect program execution. In particular, it is essential to initialize the index X mode (T) and the decimal mode (D) flags because of their effect on calculations.

Interrupts

The contents of the interrupt request bits do not change immediately after they have been written. After writing to an interrupt request register, execute at least one instruction before performing a BBC or BBS instruction.

Decimal Calculations

- To calculate in decimal notation, set the decimal mode flag (D) to "1", then execute an ADC or SBC instruction. After executing an ADC or SBC instruction, execute at least one instruction before executing a SEC, CLC, or CLD instruction.
- In decimal mode, the values of the negative (N), overflow (V), and zero (Z) flags are invalid.

Timers

If a value n (between 0 and 255) is written to a timer latch, the frequency division ratio is 1/(n+1).

Multiplication and Division Instructions

- The index X mode (T) and the decimal mode (D) flags do not affect the MUL and DIV instruction.
- The execution of these instructions does not change the contents of the processor status register.

Ports

The contents of the port direction registers cannot be read. The following cannot be used:

- The data transfer instruction (LDA, etc.)
- The operation instruction when the index X mode flag (T) is "1"
- The addressing mode which uses the value of a direction register as an index
- The bit-test instruction (BBC or BBS, etc.) to a direction register
- The read-modify-write instructions (ROR, CLB, or SEB, etc.) to a direction register.

Use instructions such as LDM and STA, etc., to set the port direction registers.

Serial I/O

In clock synchronous serial I/O, if the receive side is using an external clock and it is to output the \overline{SRDY} signal, set the transmit enable bit, the receive enable bit, and the \overline{SRDY} output enable bit to "1."

Serial I/O continues to output the final bit from the TxD pin after transmission is completed.

When an external clock is used as synchronous clock in serial I/O, write transmission data to the transmit buffer register while the transfer clock is "H."

A-D Converter

The comparator uses capacitive coupling amplifier whose charge will be lost if the clock frequency is too low.

Therefore, make sure that f(XIN) is at least on 500 kHz during an A-D conversion.

Do not execute the STP or WIT instruction during an A-D conversion.

Instruction Execution Time

The instruction execution time is obtained by multiplying the frequency of the internal clock ϕ by the number of cycles needed to execute an instruction.

The number of cycles required to execute an instruction is shown in the list of machine instructions.

The frequency of the internal clock ϕ is half of the XIN frequency in high-speed mode.

DATA REQUIRED FOR MASK ORDERS

The following are necessary when ordering a mask ROM production:

1. Mask ROM Order Confirmation Form

2.Mark Specification Form

3.Data to be written to ROM, in EPROM form (three identical copies)

DATA REQUIRED FOR ROM WRITING ORDERS

The following are necessary when ordering a ROM writing:

- 1.ROM Writing Confirmation Form
- 2.Mark Specification Form
- 3.Data to be written to ROM, in EPROM form (three identical copies)

ROM PROGRAMMING METHOD

The built-in PROM of the blank One Time PROM version and builtin EPROM version can be read or programmed with a general-purpose PROM programmer using a special programming adapter. Set the address of PROM programmer in the user ROM area.

Table 5 Programming adapter

Package	Name of Programming Adapter
42P2R-A	PCA4738F-42A
42P4B	PCA4738S-42A

The PROM of the blank One Time PROM version is not tested or screened in the assembly process and following processes. To ensure proper operation after programming, the procedure shown in Figure 49 is recommended to verify programming.

th(SCLK-RxD)	Serial I/O input hold time	200			ns

Note : When f(XIN) = 8 MHz and bit 6 of address 001A16 is "1" (clock synchronous).

Divide this value by four when f(XIN) = 8 MHz and bit 6 of address 001A16 is "0" (UART).

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Table 14 Switching characteristics 1 (Vcc = 4.0 to 5.5 V, Vss = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Baramatar	Limit	Unit		
Symbol	Falameter	Min.	Тур.	Max.	Unit
twh (Sclk)	Serial I/O clock output "H" pulse width	tc(Sclk)/2-30			ns
twL (SCLK)	Serial I/O clock output "L" pulse width	tc(Sclk)/2-30			ns
td (SCLK-TXD)	Serial I/O output delay time (Note 1)			140	ns
tv (SCLK-TXD)	Serial I/O output valid time (Note 1)	-30			ns
tr (SCLK)	Serial I/O clock output rising time			30	ns
tf (SCLK)	Serial I/O clock output falling time			30	ns
tr (CMOS)	CMOS output rising time (Note 2)		10	30	ns
tf (CMOS)	CMOS output falling time (Note 2)		10	30	ns

Notes 1: For tWH(SCLK), tWL(SCLK), when the P51/TXD P-channel output disable bit of the UART control register (bit 4 of address 001B16) is "0". 2: The XOUT pin is excluded.

Table 15 Switching characteristics 2

(Vcc = 2.7 to 4.0 V, Vss = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Cumhal	Deremeter	Limit	Llpit			
Symbol	Parameter	Min. Typ. Max.		Max.	Unit	
twh (Sclk)	Serial I/O clock output "H" pulse width	tc(ScLK)/2-50			ns	
tWL (SCLK)	Serial I/O clock output "L" pulse width	tc(Sclk)/2-50			ns	
td (SCLK-TXD)	Serial I/O output delay time (Note 1)			350	ns	
tv (SCLK-TXD)	Serial I/O output valid time (Note 1)	-30			ns	
tr (SCLK)	Serial I/O clock output rising time			50	ns	
tf (SCLK)	Serial I/O clock output falling time			50	ns	
tr (CMOS)	CMOS output rising time (Note 2)		20	50	ns	
tf (CMOS)	CMOS output falling time (Note 2)		20	50	ns	

Notes 1: For tWH(SCLK), tWL(SCLK), when the P51/TxD P-channel output disable bit of the UART control register (bit 4 of address 001B16) is "0". 2: The XOUT pin is excluded.

* 1. Confirmation

Specify the name of the product being ordered and the type of EPROMs submitted.

Three EPROMs are required for each pattern.

If at least two of the three sets of EPROMs submitted contain identical data, we will produce masks based on this data. We shall assume the responsibility for errors only if the mask ROM data on the products we produce differs from this data. Thus, extreme care must be taken to verify the data in the submitted EPROMs.

GZZ-SH53-11B<86A0>

Mask ROM number

740 FAMILY MASK ROM CONFIRMATION FORM SINGLE-CHIP MICROCOMPUTER M38503M2-XXXSP/FP MITSUBISHI ELECTRIC

We recommend the use of the following pseudo-command to set the start address of the assembler source program because ASCII codes of the product name are written to addresses 000016 to 000816 of EPROM.

EPROM type	27256	27512
The pseudo-command	*=	*=

- Note : If the name of the product written to the EPROMs does not match the name of the mask confirmation form, the ROM will not be processed.
- # 2. Mark specification

Mark specification must be submitted using the correct form for the package being ordered. Fill out the appropriate mark specification form (42P4B for M38503M2-XXXSP, 42P2R-A for M38503M2-XXXFP) and attach it to the mask ROM confirmation form.

3. Usage conditions

Please answer the following questions about usage for use in our product inspection :

(1) How will you use the XIN-XOUT oscillator?

Ceramic resonator	Quartz crystal
External clock input	Other ()
At what frequency?	f(XIN) = MHz

(2) Which function will you use the pins P21/XCIN and P20/XCOUT as P21 and P20, or XCIN and XCOUT ?

- Ports P21 and P20 function XCIN and XCOUT function (external resonator)

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

42P4B (42-PIN SHRINK DIP) MARK SPECIFICATION FORM

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

SHRINK DIP MARK SPECIFICATION FORM for One Time PROM version microcomputers

Enter the catalog number of the microcomputer for which this mark specification is intended. (If you do not know the ROM code number, enter XXX in its place.)

The catalog number of the microcomputer

M

A. Standard Mitsubishi Mark

Customer specified part number will be printed together with the ROM code number on the top line. Enter the desired part number left aligned in the box below. (up to 10 characters)

								Note2 :
								RXXX
Mitsubishi catalog name (blank model number before writing)							writing)	
				Mitsubishi lot number (6-digit or 7-digit)				

Note1 : The following characters can be used in the part number :

Uppercase alphabet, numbers, ampersand, hyphen, period, comma, +, /, (,), $\ensuremath{\mathbb{C}}$

- ($\ensuremath{\mathbb{C}}$ will be printed at 1.5 × character width)
- 2: XXX is the ROM code number.
- B. Special Mark Required

If you desire anything other than the standard Mitsubishi mark, it will be treated as a special mark.

Special marks will take longer to produce and should be avoided if possible.

If a special mark is to be printed, indicate the desired layout of the mark in the figure below. The layout will be duplicated as closely as possible.

Note1 : If the customer's trademark logo must be used in the Special Mark, please submit a clean original logo. Note that special marks require extra cost and time to produce.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

PACKAGE OUTLINE

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Keep safety first in your circuit designs!

 Misubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placemer substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap. ent of

Notes regarding these materials

- Notes regarding tresse materials.
 These materials are interference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
 Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.
