# LINEAR INTEGRATED CIRCUIT

## COMPLETE TV SOUND CHANNEL

The TDA 1190 is a monolithic integrated circuit in a 12-lead quad in-line plastic package. It performs all the functions needed for the TV sound channel:

- IF limiter-amplifier
- Active low-pass filter
- FM detector
- DC volume control
- AF preamplifier
- AF output stage

The TDA 1190 can give an output power of 4.2W ( $d = 10\%$ ) into a  $16\Omega$  load at  $V_s = 24V$ , or 1.5W ( $d = 10\%$ ) into an  $8\Omega$  load at  $V_s = 12V$ . This performance, together with the FM-IF section characteristics of high sensitivity, high AM rejection and low distortion, enables the device to be used in almost every type of television receivers. The device has no irradiation problems, hence no external screening is needed.

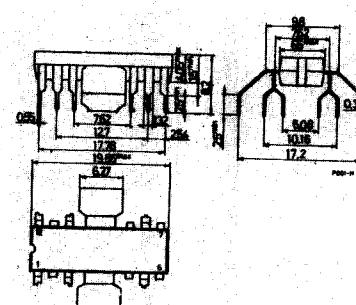

## ABSOLUTE MAXIMUM RATINGS

$V_s$	Supply voltage (pin 10)	28	V
$V_i$	Input signal voltage (pin 1)	1	V
$I_o$	Output peak current (non-repetitive)	2	A
$I_{o\text{r}}$	Output peak current (repetitive)	1.5	A
$P_{\text{tot}}$	Power dissipation: at $T_{\text{tab}} = 90^\circ\text{C}$ at $T_{\text{amb}} = 80^\circ\text{C}$ (free air)	5	W
$T_{\text{stg}}, T_j$	Storage and junction temperature	1	W
		-40 to 150	°C

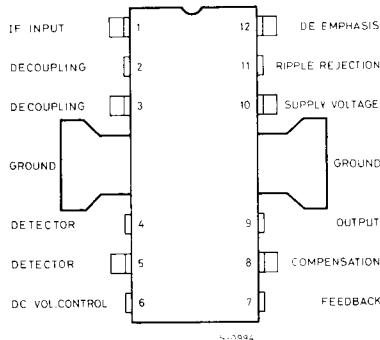

ORDERING NUMBER: TDA 1190

## APPLICATION INFORMATION

The electrical characteristics of the TDA 1190 remain almost constant over the frequency range of 4.5 to 6 MHz, therefore it can be used in all television standards (FM mod.). The TDA 1190 has a high input impedance, so it can function with a ceramic filter or with a tuned circuit that provide the necessary input selectivity.

The value of the resistor connected to pin 7, determines the AC gain of the audio frequency amplifier. This enables the desired gain to be selected in relation to the frequency deviation at which the output stage of the AF amplifier must enter into clipping.

The capacitor connected between pins 9 and 8 determines the upper cut-off frequency of the audio band.

The capacitor connected between pin 12 and ground, together with the internal resistor of 10 kΩ, forms the de-emphasis network. The Boucherot cell eliminates the high frequency oscillations caused by the inductive load and the wires connecting the loudspeaker.

## MOUNTING INSTRUCTION

The  $R_{\text{th,j-amb}}$  of the TDA 1190 can be reduced by soldering the tabs to a suitable copper area of the printed circuit board (Fig. 18) or to an external heatsink (Fig. 19).

The diagram of figure 20 shows the maximum dissipable power  $P_{\text{tot}}$  and the  $R_{\text{th,j-amb}}$  as a function of the side "l" of two equal square copper areas having a thickness of  $35 \mu$  (1.4 mils).

During soldering the tab temperature must not exceed  $260^{\circ}\text{C}$  and the soldering time must not be longer than 12 seconds.

The external heatsink or printed circuit copper area must be connected to electrical ground.
